

Deploy and scale Microsoft Azure Cloud Native infrastructures and applications with Red Hat Ansible Automation

Stuart R. Kirk, RHCA
Azure Global Black Belt / Cloud Native stuart.kirk@microsoft.com

Zim Kalinowski Senior Software Engineer zikalino@microsoft.com

Tuesday April 28th, 2020 Wednesday April 29th, 2020

STUART KIRK

Azure Global Black Belt / Cloud Native Microsoft Corporation

- Cloud Native / Open Source Technical Specialist
- Home: Ann Arbor, Michigan, Originally from Canada
- Entirety of Career in Open Source: Dell, Cisco, Red Hat
- Joined Microsoft in 2016; First RHCA at Microsoft
- Enjoys: Watching hockey (Go Leafs Go!), Cruising, Disney, Target Shooting, Rock Concerts
- Twitter: @StuartAtMSFT
- GitHub: https://github.com/stuartatmicrosoft
- LinkedIn: https://www.linkedin.com/in/stuartkirk

ZIM KALINOWSKI

Senior Software Engineer Microsoft Corporation

 Used to live in Shanghai, China, now in exile in Europe

Currently making Ansible the ultimate tool to deploy resources on Azure.

Passionate about Azure REST API.

 Before joining Microsoft worked for Nokia, Opera Software, Qualcomm and created own startup.

· Also likes American craft beer and all kinds of BBQ

Twitter: @ZimOnAzure

GitHub: https://github.com/zikalino

LinkedIn: https://www.linkedin.com/in/smarterphone

JOHN YOKIM

Director, Azure Solutions Business Microsoft Corporation

Born, Raised and Live in Pittsburgh, PA

Joined Microsoft in 2000

Working on all things related to Azure since 2013

• Enjoys: Anything Outdoors – Skiing, Fly Fishing, Hiking, Biking, etc...

LinkedIn: https://www.linkedin.com/in/johnyokim/

Twitter: @johnyokim

JULES OUELLETTE

Senior Cloud Solutions Architect Microsoft Corporation

- Lives in Saskatoon, Saskatchewan, Canada
- Helping customers deploy solutions to Azure.
- Have done a little bit of everything over 20 years in IT.
 Networking, integration, application development, infrastructure design, analytics.
- Part of a local "maker" community, have built 7 different 3d printers from scratch using a variety of materials (including recycled shelving!)
- Enjoys: Weightlifting in my garage, making things.
- LinkedIn: https://www.linkedin.com/in/jules-ouellette/
- GitHub: https://github.com/jmo808

CONNECTING

OBTAINING YOUR LAB DESKTOP

- Your lab VM is provided using a content delivery environment from Spektra Systems
- To obtain your Linux desktop you will need to register on the Spektra website
- You can access your lab VM by VNC to obtain a GUI console, or via SSH

Deploy & scale Microsoft Azure Cloud Native Infrastructures & applications with Red Hat Ansible

By: Microsoft

Welcome to Deploy & scale Microsoft Azure Cloud Native Infrastructures & Applications with Red Hat Ansible!

The lab content provided is in a hands-on lab format in the spirit of a formal "Hackathon". You will learn how to connect Ansible to Microsoft Azure and the concepts of third party application connectivity including the notion of service principals. You will deploy laaS, PaaS and other Cloud Native workloads to the various different Azure solutions offerings shown below and subsequently be able to explore and manipulate the applications once they are live. As part of this lab, you will use the example playbooks found in the lab GitHub that provide the building blocks to extend your existing enterprise Ansible deployment to Azure.

The lab content will include deployment of the following Azure technologies:

- Application Gateway
- Azure Red Hat OpenShift
- Container Registry (ACR)
- CosmosDB
- Database for MySQL
- Functions (Serverless Computing)

SUBMIT

OBTAINING YOUR LAB DESKTOP

- The login credential information for your lab will be available immediately
- Click the "LAUNCH LAB" button as shown:

Overview Lab

Welcome to Deploy & scale Microsoft Azure Cloud Native Infrastructures & Applications with Red Hat Ansible!

The lab content provided is in a hands-on lab format in the spirit of a formal "Hackathon". You will learn how to connect Ansible to Microsoft Azure and the concepts of third party application connectivity including the notion of service principals. You will deploy laaS, PaaS and other Cloud Native workloads to the various different Azure solutions offerings shown below and subsequently be able to explore and manipulate the applications once they are live. As part of this lab, you will use the example playbooks found in the lab GitHub that provide the building blocks to extend your existing enterprise Ansible deployment to Azure.

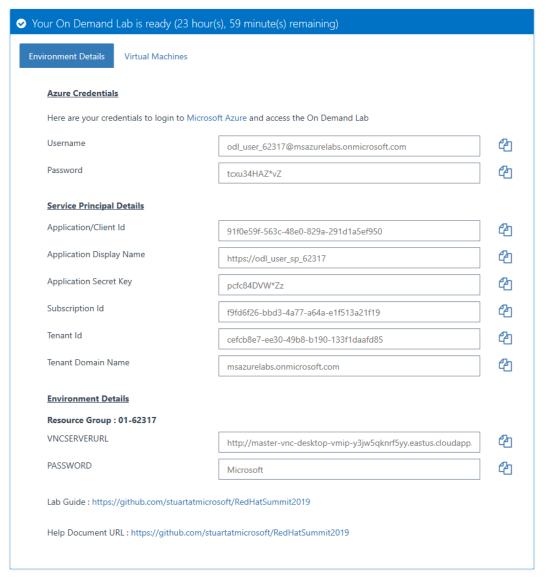

The lab content will include deployment of the following Azure technologies:

- Application Gateway
- Azure Red Hat OpenShift

OBTAINING YOUR LAB DESKTOP

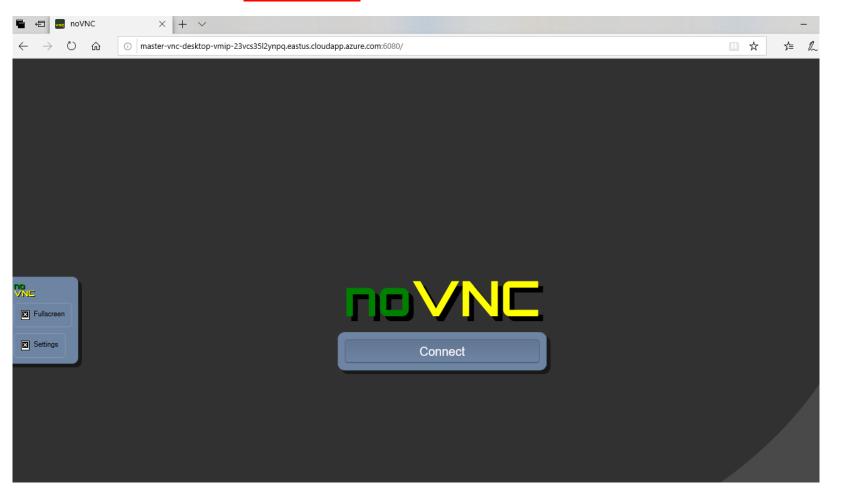

- The login credential information for your lab will be available immediately
- Click the "LAUNCH LAB" button as shown:
- For VNC connectivity, you will need the following:
 VNCSERVERURL
 PASSWORD
- For SSH connectivity, you will need the following:
 HOST FQDN & PORT
 ACCOUNT NAME & PASSWORD
- Connect to VNCSERVERURL via http / https
- All VNC & account passwords are Microsoft
- All other data is available on the lab VM

OBTAINING YOUR LAB DESKTOP WITH VNC

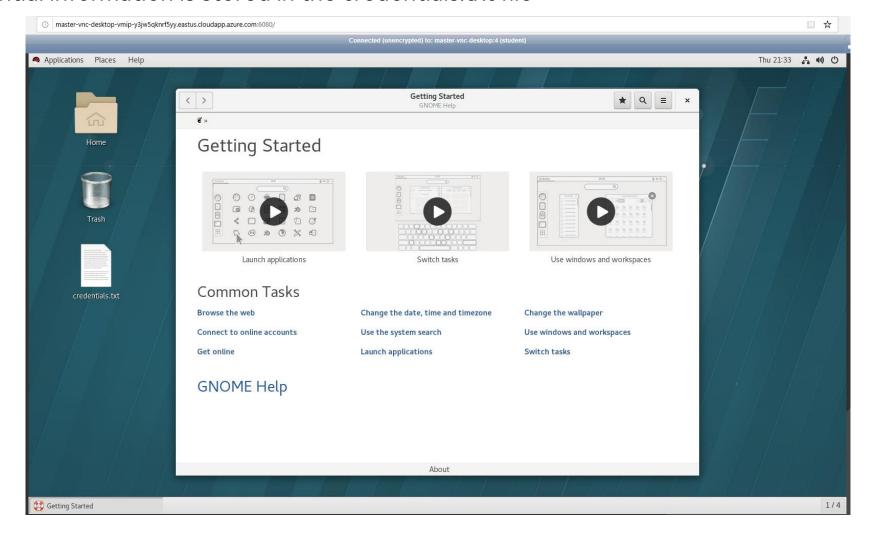

- Your VNCSERVERURL should produce a login page similar to the illustration below
- All VNC & account passwords are <u>Microsoft</u>

OBTAINING YOUR LAB DESKTOP WITH VNC

- Your lab environment will be delivered from a RHEL 8.2, GNOME3-classic-based host
- All credential information is stored in the credentials.txt file

OBTAINING YOUR LAB DESKTOP WITH SSH

• ssh student@master-vnc-desktop-vmip-xxxxxx.region.cloudapp.azure.com -p 2112

```
[stkirk@stkirk-fedora ~]$ ssh student@master-vnc-desktop-vmip-3tobr7hzna6ri.southcentralu
Warning: Permanently added '[master-vnc-desktop-vmip-3tobr7hzna6ri.southcentralus.cloudap
list of known hosts.

QUICK START

The following commands, as part of the runbook, are a "quick start" to begin working on the labs

- Generate a GitHub personal access token per the instructions in the runbook
- az login (VNC) --OR- az login -u odl_user_1234@something.onmicrosoft.com -p 5om3-cr4zyPa\$\$w0rd!(SSH)
- git clone https://github.com/stuartatmicrosoft/RedHatSummit2020
- cd RedHatSummit2020/playbooks
- pip2.7 install --user ansible[azure]
- ./lab-build.sh

PLEASE VIEW / DOWNLOAD THE RUNBOOK AT THE GITHUB:

https://github.com/stuartatmicrosoft/RedHatSummit2020/blob/master/lab-runbook.pdf

TIPS

Overall

- Set the default Azure Linux CLI output type to "3 Table" by using the "az configure" command
- The Azure credentials are in the file "credentials.txt" on the desktop / in the "Desktop" directory
- DO NOT DELETE any assets in your resource group beginning with master-vnc- or you will lose
 your Linux VM and your lab will be over!
- Lab environments will be available for 24 hours and cannot be re-provisioned after that time
- Some labs take a long period of time to run; Feel free to move on to a second lab and work concurrent

For VNC Users

- It is recommended that you stay entirely within the noVNC environment
- If you need to access a web browser, use the Firefox web browser already loaded on your lab VM host
- Copying and pasting content in/out of the lab VM is very cumbersome

For SSH Users

- Make sure that you connect to your host using port 2112 with the username "student"
- To log in to the Azure Linux CLI you need to use the command: "az login -u odl_user_1234@something.onmicrosoft.com -p 5om3-cr4zyPa\$\$w0rd!".

LAB CONTENT OVERVIEW

OpenShift Container Platform on Virtual Machines

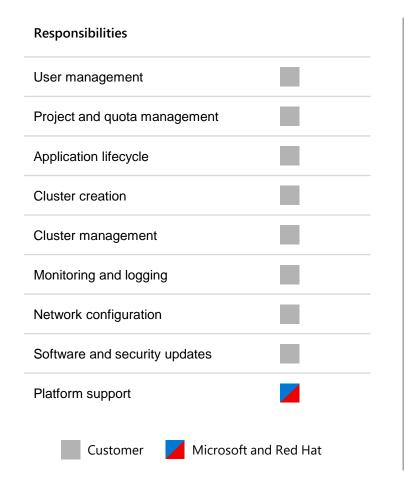

- Deploy through https://cloud.redhat.com/openshift
- Self-managed on infrastructure as a service (laaS)
- Bring your own license

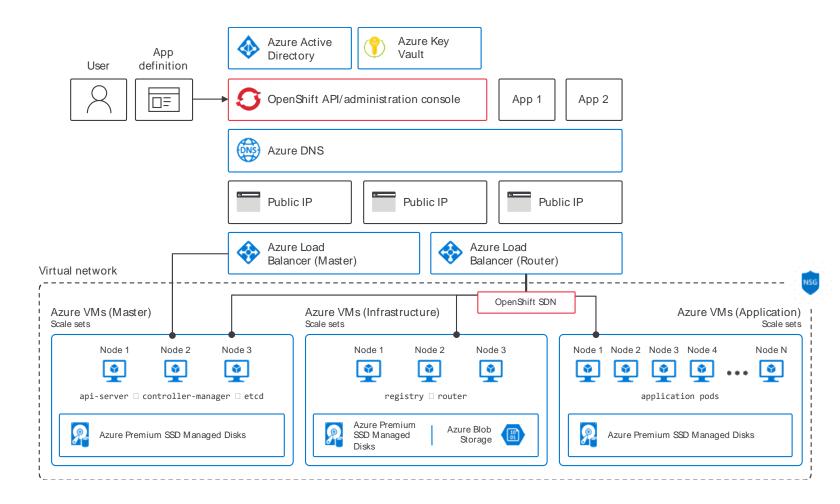

Azure Red Hat OpenShift

- Deployed through the Azure Portal or the Azure CLI
- Fully-managed and supported Red Hat OpenShift platform
- Billing integrated in your Azure subscription

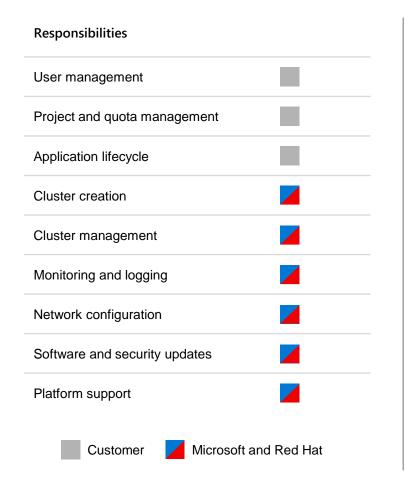

OPENSHIFT CONTAINER PLATFORM ON VMs

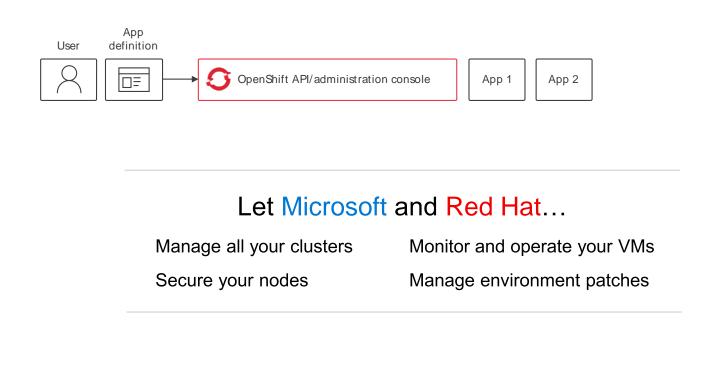

FULLY MANAGED CLUSTERS WITH AZURE RED HAT OPENSHIFT

LAB OVERVIEW – Azure Red Hat OpenShift

Summary:

Deploy various applications into an existing Azure Red Hat OpenShift cluster

Lab Goals:

- Login and obtain access to Azure Red Hat OpenShift
- Create OpenShift projects (namespaces) for the two applications to be deployed
- Deploy an application using Source-To-Image capabilities of OpenShift and monitor the output logs
- Switch projects to deploy the second application (Microsoft SQL Server 2017)
- Create an OpenShift secret to house the administrator password for the database
- Apply a persistent volume claim & configuration to deploy Microsoft SQL Server 2017

Playbooks:

aro-00-login-namespace.yml (0m12s) aro-01-deploy-mssql-server.yaml (0m10s)

LAB OVERVIEW – High Performance Computing

Summary:

Create an Infiniband enabled HPC cluster and test intra-VM latency

Lab Goals:

- Create a master node to serve as an NFS master for the HPC compute nodes
- Create three compute nodes utilizing Azure's Infiniband VM interconnects
- Measure the latency between TCP and DAPL-based connections using Intel MPI

- hpc-00-cluster-master-deploy.yml (2m59s)
- hpc-01-cluster-master-configure.yml (4m4s)
- hpc-02-cluster-compute-deploy.yml (8m44s)
- hpc-03-cluster-compute-configure.yml (3m34s)

LAB OVERVIEW – Big Data (HDInsight)

Summary:

Deploy a platform based Big Data solution & Perform various queries

Lab Goals:

- Create an HDInsight Cluster
- Explore the resulting configuration
- Perform several manual queries on the sample data sets

Playbooks:

hdinsight-40-create-hdinsight.yml (18m38s)

LAB OVERVIEW – Azure Kubernetes Service (AKS)

Summary:

Deploy an application which uses microservices to provide various earth/climate related details

Lab Goals:

- Create a managed AKS instance in Azure
- Obtain Kubernetes credentials from Azure & merge into ~/.kube
- Create an Azure Container Registry
- Build / Tag / Push containers to Azure Container Registry using Podman
- Deploy the Kubernetes configuration files

- aks-00-create-aks-cluster.yml (7m47s)
- aks-01-create-acr.yml (0m12s)
- aks-02-build-tag-push.yml (2m40s)
- aks-03-deploy-k8s.yml (0m50s)

LAB OVERVIEW – Azure Web Apps / NoSQL

Summary:

Modernize a local infrastructure application to a platform-based service

Lab Goals:

- Containerize a NodeJS Application running locally on your desktop
- Use Azure Container Registry to store the container
- Create an Azure CosmosDB (MongoDB)
- Export data from a local MongoDB and import into Azure CosmosDB
- Create an Azure Web Application to consume the containerized application in ACR

- todo-00-create-acr.yml (0m9s)
- todo-01-create-cosmosdb.yml (4m45s)
- todo-02-create-appservice-plan.yml (0m11s)
- todo-03-create-azure-webapp.yml (0m30s)

LAB OVERVIEW – Azure Functions (Serverless)

Summary:

Run Ansible as a container-based function app on Azure. Create entire serverless pipeline triggered from GitHub, including static web page to test it using Azure Storage.

Lab Goals:

- Create function app Docker image in Azure Container Registry using ACR task
- Create function app using image from ACR
- Create a static web page utilizing function app using Azure Storage

- fa-00-create-image.yml
- fa-O1-create-function-app-from-acr.yml
- fa-02-create-website.yml

LAB OVERVIEW - laaS / PaaS / Application Deploy

Summary:

Deploy a highly available application using IaaS / PaaS / Auto Scaling

Lab Goals:

- Configuring Infrastructure and Platform services on Azure with applications
- Creating a disk image to scale the infrastructure node
- Using virtual machine scale sets and Azure application gateway for resiliency

- mm-00-prerequisites.yml (16m25s)
- mm-01-vm-deploy.yml (3m24s)
- mm-02-create-mysql.yml (3m10s)
- mm-03-setup-mattermost.yml (1m44s)
- mm-04-create-vm-image.yml (1m11s)
- mm-05-vmss-create.yml (3m37s)
- mm-06-appgateway-attach.yml (6m2s)

REPLICATING YOUR OWN LAB ENVIRONMENT

REPLICATING YOUR OWN LAB ENVIRONMENT

Replicating this environment in your own subscription is relatively simple and can be done using the Azure Linux CLI:

- az group create -n 'rg_name' -l 'eastus' (Pick your closest Azure Data Center)
- az group deployment create --template-uri https://raw.githubusercontent.com/stuartatmicrosoft/RedHatSummit2020/master/ provision-scripts/deploy-01.json --parameters https://raw.githubusercontent.com/stuartatmicrosoft/RedHatSummit2020/master/ provision-scripts/deploy-01.parameters.json -g rg name
- az vm list -d | grep master-vnc | awk '{print \$6}'
- You will need to create your own service principal to connect Ansible to Azure
- Connect to this FQDN via http or https on port 6080 or SSH to the VM on port 2112
